### Theme and Organisation of the conference

Innovation is seen as a way of responding to climate change, social inequalities, economic challenges, the provision of services and the building of infrastructure. Yet it can also be seen as the cause of many of the challenges that cities and regions now face: indeed, in its broadest sense innovation simply means change, and the consequences of many of the changes wrought over the last century and a half are now being understood.

Innovation has been enshrined as a pillar of economic agenda at all government scales. The government of Canada's supercluster policy (2018) makes explicit that it sees innovation as linked to regional processes. The policy itself reflected the wider claim that cities and regions need to innovate yet these are vague claims in need of investigation.

This conference will provide the opportunity for urban and regional scholars to grapple with the complexities of innovation and change, qualifying the idea of innovation, questioning the institutions that organize and channel it, and exploring the actors, private, public and civil society, who instigate change and cope with its consequences. To what extent are innovate processes regionally embedded? Can radical innovation occur within the current institutional context? Who innovates? Who benefits? Is it possible, or useful, to think through the consequences of innovation? Is it always necessary or advisable to innovate? Can innovation lead to more inclusive forms of growth? How does innovation impact cities and regions – in terms of their governance, their economies, their infrastructure and their social cohesion? And, conversely, how do cities and regions, as polities, innovate, influence innovation, adapt to change, and channel its consequences? These are some of the questions that will be addressed in Montréal.
